### Codeigniter User Guide Session

The architecture of Codeigniter application is shown below. As shown in the figure, whenever a request comes to Codeigniter, it will first go to index.php page.. In the second step, Routing will decide whether to pass this request to step-3 for caching or to pass this request to step-4 for security check. If the requested page is already in Caching, then Routing will pass the request to step-3 ...

### Codeigniter Guide - ci-guide.info

The key abstraction of information in REST is a resource. Any information that can be named can be a resource: a document or image, a temporal service (e.g. "today's weather in Los Angeles"), a collection of other resources, a non-virtual object (e.g. a person), and so on.

### REST Resource Identifier (URI) Naming - REST API Tutorial

User Acceptance is defined as a type of testing performed by the Client to certify the system with respect to the requirements that was agreed upon. This testing happens in the final phase of testing before moving the software application to the Market or Production environment. The main purpose of ...

### What is User Acceptance Testing (UAT)? with Examples

As we know Database is a collection of tables that stores data in it. To retrieve or fetch data from MySQL database it is simple to do it using MySQL " Select " query in PHP . Here in this blog post we will be going to see how to fetch data and to display it in front end.

### Retrieve or Fetch Data From Database in PHP | FormGet

A defect is a variation or deviation from the original business requirements These two terms have very thin line of difference, In the Industry both are faults that need to be fixed and so interchangeably used by some of the Testing teams. When a tester executes the test cases, he

might come across ...

Hi, might be helpful for someone: after you receive the response, please close HttpPost (HttpGet) :  
post.releaseConnection(); Else after 2 times you will have no free connections and will have to wait  
infinitely for them to release - no exception will be thrown.

### **Apache HttpClient Examples - Mkyong.com**

Basically, problem\_1\_table is a table that contains the (user\_id, score) pair for submissions with  
problem\_id = 1, and so on. Afterwards, we join with them on the user\_id to produce the table we  
want.. In fact, this was our original approach to the problem! The website was built with Ruby on  
Rails, and we used a loop in Ruby to loop through all problems and generate the corresponding SQL  
query.

TIP: Try using a server-set cookie, such as PHP's \$\_SESSION, or even .Net's Response.Cookies, to  
maintain "where" your client is in your site. This is the more Vanilla way to do what I do with CI's  
Session class. The big difference being that CI uses a Table in your DB, whereas these vanilla  
methods store an editable cookie in the client. The downside though, is a user can clear its cookies.
